

Menota: The main corpus

The main corpus consists of all Menota texts apart from charters and runic inscriptions. All texts in the main corpus are based on complete codices (sometimes with lacunas) or on fragments of once complete codices. They span from tiny fragments of just above 100 words up to large codices of more than 100,000 words. Each physical document is regarded as a single text bearer.

When selecting a text (by clicking on it in the second column), a context-sensitive menu bar with tick boxes will appear. If the text has been encoded on more than one level, tick boxes for **Facs**, **Dipl** and **Norm** will appear – select any combination of levels. Note that the majority of texts have only been encoded on a single level, usually the Dipl level, so they do not offer this option. Ticking a **Clean text** box hides all notes.

If there is a parallel photographic facsimile of the text, it can be opened by ticking **Photo**. Photographic facsimiles can be modified by a slider so that they tally with the lines of the text.

In texts that have been annotated for morphology, click on any word to see its full morphology (always its dictionary entry, lemma, and corresponding word class, in most cases also its grammatical form), and find a link to Fritzner's dictionary for this specific word.

If the text has been annotated for syntax, a **Show syntax** tick box will appear with a choice of two views, linear and tree. The text will now display sentence borders by green **<s>** symbols; click on any such symbol to see the syntactic analysis of the following sentence.
