Suggestions for textual display

Odd Einar Haugen, 10 November 2017

SIGN	MEANING	ENCODING	UNICODE
` ... ´	added by the scribe (supralinear)	<add place="supralinear">...</add>	2E0C + 2E0D
, ... \	added by the scribe (marginal)	<add place="margin-left">...</add> <i>also</i> "margin-right", "margin-top", "margin-bot"	2E1D + 2E1C

Note: If there is no place attribute in the <add> element, the first display above is the default one.

{ ... }	deleted by the scribe	...	2E20 + 2E21
◌̣	unclear	<unclear>...</unclear>	0323

Note: The dot below is the standard display for any character (or strings of characters) which has an unclear reading.

[...]	restored by the editor	<supplied>...</supplied> <i>includes</i> reason="damage" <i>and</i> reason="missing"	005B + 005D
< ... >	added by the editor	<supplied type="clarification">...</supplied>	27E8 + 27E9

Note: This is a new distinction, explained in *The Menota Handbook* v. 3.0, ch. 9.3.1. The default display is ordinary square brackets. The open angle brackets should only be used in the case of **type="addition"**, and typically on the normalised level.

{ ... } deleted by the editor <me:suppressed>...</me:suppressed>

Note: The previous element <me:expunged> is also allowed in the Menota schema, but we recommend a migration to the new element <me:suppressed>. See *The Menota Handbook* v. 3.0, ch. 9.3.2 for the element and its display.

	unusual or mistaken form	<sic>...</sic>	
★	corrected form	<corr>...</corr>	002A asterisk

Note: In a multi-level encoding, the <sic> reading will be on the facsimile level and it need not be highlighted in any way. The reading is simply what the manuscript offers. The <corr> reading will be found on the normalised level, and preferably also on the normalised level. On these levels, the reading in the <corr> element should be given, but with a note (by way of an asterisk or otherwise) about the <sic> reading, and possibly a comment as to why it has been corrected.

-	hyphen in the source	<c type="hyphen">-</c>	002D ordinary hyphen
·	no hyphen in the source	not encoded, but a middot supplied by the stylesheet, preferably on the <i>dipl</i> and <i>norm</i> levels only	00B7 middot

The Menota Handbook v. 3.0 can be accessed at http://www.menota.org/HB3_index.xml
